AMAZONAS
Campus Manaus-Centro

INGLÊS APLICADO
Profaª YNA HONDA ☺

Student: _____ Date: _____

GRUPOS NOMINAIS, SIGLAS & ACRÔNIMOS

1. Passe os seguintes grupos nominais para o Português:

a. Data communication processor - _____
b. Artificial intelligence - _____
c. Backup system - _____
d. Secondary memory - _____
e. Control structure - _____
f. Central processing unit - _____
g. Operating system - _____
h. Access control - _____
i. Data processing department - _____
j. Control Circuits - _____
k. Automatic electronic devices -_____
l. Last generation program - _____
m. Correctly programmed data - _____
n. Computer integrated circuits - _____

2. Observe as siglas e acrônimos abaixo, analise os grupos nominais e passe-os para o Português:

1. ASP (Application Service Provider) = _____
2. CDMA (Code Division Multiple Access) = _____
3. CSS (Cascading Style Sheets) = _____
4. DHCP (Dynamic Host Configuration Protocol) = _____
5. DHTML (Dynamic HyperText Markup Language) = _____
6. DNS (Domain Name System) = _____
7. FAQ (Frequently Asked Questions) = _____
8. FTP (File Transfer Protocol) = _____
9. HDD (Hard Disk Drive) = _____
10. HTML (HyperText Markup Language) = _____
11. HTTP (HyperText Transfer Protocol) = _____
12. IMAP (Internet Message Access Protocol) = _____
13. IP (Internet Protocol) = _____
14. ISP (Internet Service Provider) = _____
15. IT (Information Technology) = _____
16. LAN (Local Area Network) = _____
17. OSI (Open Source Initiative) = _____
18. PPP (Point to Point Protocol) = _____
19. SQL (Structured Query Language) = _____
20. TCP (Transmission Control Protocol) = _____
21. URI (Uniform Resource Identifier) = _____
22. URL (Uniform Resource Locator) = _____
23. VPN (Virtual Private Network) = _____
24. WAN (Wide Area Network) = _____
25. Wi-Fi (Wireless Fidelity) = _____

3 - Identifique o grupo nominal nas frases abaixo e sublinhe/destaque o substantivo núcleo:

- The new server is much faster than the old one.
- We need to upgrade the operating system to the latest version.
- The security vulnerability was patched last week.
- High-level programming languages are easier to learn.
- The distributed system handled the request efficiently.

4 - Analise os textos A e B a seguir. Responda às perguntas propostas em cada um:

Text A
Agile and Software Development

Our software development team uses the scrum methodology to manage our workflow. We start the day with a daily stand-up meeting to synchronize tasks for the sprint. The product owner revises the backlog to prioritize the most important features for the next release. The coding itself is done on a robust framework, and every commit goes through a code review before being approved. The debugging of a critical bug is our main priority right now, and we hope to do the deployment of the fix today.

4.1 Identifique os cognatos no texto A e escreva as respectivas traduções.

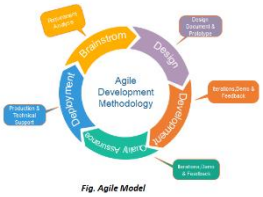

Fig. Agile Model

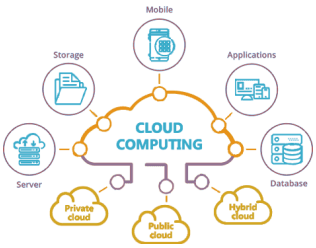

4.2 Liste os estrangeirismos e explique o seu significado no contexto da ciência da computação.

4.3 Liste os grupos nominais que descrevem processos ou ferramentas da equipe.

Text B
Network Infrastructure and Cloud Computing

To ensure data availability, our company migrated its entire network infrastructure to a cloud computing provider. We no longer depend on physical hardware in our office. The hosting service for our servers is managed directly in the cloud, with a robust firewall protecting all network traffic. We do a daily backup of our databases and transfer them to a remote storage. This allows us to guarantee 99.99% uptime, with continuous data streaming for our clients, without any issues with upload and download.

4.4 Identifique os cognatos no texto B e escreva as respectivas traduções.

4.5 Liste os estrangeirismos relacionados à infraestrutura de rede e nuvem.

4.6 Liste os grupos nominais que se referem a componentes de hardware ou conceitos de rede.

5 - O texto a seguir aborda conceitos mais complexos de cibersegurança e redes. Leia-o, identifique os sintagmas nominais e interprete o papel de cada sigla no contexto do texto.

Advanced Cybersecurity and Network Protocols

Effective network security relies on a robust Public Key Infrastructure (PKI) to manage digital certificates and encryption keys. This foundation ensures the secure exchange of data between clients and servers. For internal network routing, organizations often deploy Open Shortest Path First (OSPF), a dynamic routing protocol that enables routers to discover the most efficient path for data traffic. Furthermore, for a seamless user experience, a system might leverage Security Assertion Markup Language (SAML), a protocol for federated identity, allowing a single authentication to access multiple web-based applications securely. This complex interaction between various protocol stacks is crucial for maintaining a secure and performant network environment.

5.1 Encontre e liste cinco sintagmas nominais que descrevem conceitos ou sistemas de segurança e redes.

5.2 O texto menciona três siglas mais complexas. Identifique-as e explique, com base no texto, o papel de cada uma: PKI, OSPF e SAML.

5.3 De acordo com o texto, qual é a principal vantagem de usar o Open Shortest Path First (OSPF)?
